

METALLIZING

APPLICATION

METHOD	USAGE	PROCESS
Gas Flame Gun	To repair damaged galvanized coatings and to coat small jobs where overspray is a concern.	Combustible gas is used to melt a single wire. Compressed air then blows the atomized particles onto the steel's surface.
Arc-Spray	To meet the demands of large jobs that require a considerable amount of zinc deposited at a rapid rate to meet delivery commitments.	The arc-spray gun simultaneously feeds two electrically charged wires into an arc. This melts the zinc, and compressed air then blows the particles onto the steel's surface.
